Each of the models in this book is both beautiful and interesting to make. Each also plays its part as a hands-on introduction to geodesic domes. With the aid of its models, this book explains the underlying theory for designing geodesic domes and shows how a sphere can be divided and subdivided symmetrically in order to create dramatic buildings which are light and strong and also have no need of internal support.

A Childrens book with cutout domes.

By A Customer

Don't be fooled by the title of this book. It is not an architectural treatise, it's a children's book with cutouts that let you make a paper model. If you want a good book on the architecture of Geodesic Domes, buy a biography of Buckminster Fuller.

The geometry of geodesic domes using cut-out models

By A Customer

This is classified as a children's book, but it isn't so simple. It would be suitable for teenagers but the mathematics is relevant whatever your age and it is described clearly and concisely. However, if you're looking for a book on dome architecture this is not for you. There are two models that demonstrate the ideas about the subdivision of triangles to approximate the sphere based on the octahedron and the icosahedron. Then there are three 'architectural' dome models and lastly a model of the carbon molecule buckminsterfullerene. Each model is included for a reason and there's an explanatory text to accompany each one. The book does not cover real examples of domes much (only a sketch of the Expo 67 pavilion), although the introduction briefly explains the history and reason for them. It is important to understand that

this is not a book about dome architecture: it covers the math behind the concept and explains it using cut-out models.
